1.0 INTRODUCTION

1.1 GENERAL

Huntley Wood Investments are proposing to market a site at Ardagh Metal Packaging, Abercanaid, Merthyr Tydfil for mixed residential and commercial end-use.

Intégral Géotechnique (Wales) Limited have been appointed as the Geotechnical Engineers to undertake a geoenvironmental and geotechnical desk study.

The objectives of the geoenvironmental and geotechnical appraisal are to:

- Assess the degree, nature and extent of possible contamination and its implications for ownership and site development;
- Identify any geotechnical constraints on development; and
- Provide recommendations for physical site investigation works.

This report presents the findings of the desk study, and provides guidance on the scope of the geoenvironmental and geotechnical investigation.

The opinions and preliminary assessments presented are based on desk based research and should be reviewed after intrusive investigation, if required.

1.2 PROPOSED DEVELOPMENT

The proposed development will comprise of a mixture of residential and commercial end use, with associated access road, areas of hardstanding, soft landscaping and private gardens.

1.3 SCOPE OF WORKS

The work instructed included a desk study of available information, together with an initial conceptual site model. The desk study comprised a review of:

- An Envirocheck Report obtained for the site
- Old Ordnance Survey maps covering the site, included within the Envirocheck Report
- A Coal Authority Mining Report
- Geological maps of the area provided by the British Geological Survey
- the Environment Agency groundwater vulnerability map and aquifer database for the area

1.4 LIMITATIONS

This document is intended to be a working document for further development in discussion with all concerned including the Local Planning Authority, Natural Resources Wales and the NHBC, as appropriate.

“Contamination” is taken throughout the report to mean the “presence of one or more potentially harmful substances as a result of human activity”. The use of the term in this way does not imply that harm is being or might be caused by the contamination. It should be noted that “contamination” can have different meanings under different regulatory regimes, for example, planning, building control and Part IIA of the Environmental Protection Act 1990. Naturally elevated concentrations of potentially harmful substances may also be of concern and the significance of any that have been found is also evaluated in this report.

This report has been prepared for the use of Huntley Wood Investments Limited, and their advisors, and should not be passed to others without the express consent of Intégral Géotechnique (Wales) Limited.

2.0 THE SITE

2.1 SITE LOCATION AND DESCRIPTION

The site is located in Abercanaid, approximately 2.5km south of Merthyr Tydfil, at a National Grid Reference of 305460, 204240 see Figure 1.

The site is irregular in shape and occupies an area of approximately 8.13 hectares. The boundaries of the site are defined by the River Taff to the east, an unnamed road to the south and west and a warehouse to the north. A site plan is presented in Figure 2.

The site is situated on sloping ground, what slopes from an approximate elevation of 162m AOD in the east, to 157m AOD in the south.

The site is situated on the floodplain of the River Taff, however the site level has been raised, to its current elevation.

The site currently consists of a concrete slab, which remains from the demolition of the previous buildings onsite, with stockpiles of brick rubble and demolition waste. The northern area of the site is covered by an area of soft finishing. A vacant building currently exists in the far south of the site, with an enclosed walkway that crosses the River Taff. Site photographs are presented in Figure 3.

2.2 SITE OPERATIONS

The site is vacant and the majority of the site covered in hardstanding or concrete slab remaining from the demolition of previous buildings.

The northern part of the site is covered by an area of soft finishing.

2.3 SURROUNDING LAND USE

To the south and south west of the site lie residential areas. To the west lies open land with by the A470 beyond. To the north lie commercial/ industrial properties. The River Taff forms the eastern site boundary.

2.4 AVAILABLE SITE INVESTIGATION DATA

Intégral Géotechnique (Wales) Limited has carried out the following report on the site:

- Coal Mining Risk Assessment, Ardagh Metal Packaging, Abercanaid, Merthyr Tydfil, dated February 2016 (Reference: 11708/LW/16/CMRA).

3.0 SITE HISTORY

The recent history of the site has been traced with the aid of an Envirocheck Report, a copy of which is included in Appendix A. The Envirocheck Report includes the following scaled historical maps:

Map Scale	Dates
1:2,500	1876-1881, 1881, 1900, 1919, 1964, 1972, 1972-1983, 1979, 1986, 1986, 1986-1988, 1988, 1993
1:10,560	1884, 1885, 1901, 1905, 1922, 1938, 1945, 1951.
1:10,000	1964-1965, 1969, 1970-1979, 1982-1989, 1990-1992, 2006, 2015

The earliest map in our possession, dated 1884, shows the site to be predominantly covered in colliery spoil heaps. An Old Coal Shaft was noted in the centre of the site.

A dock intercepted the far western central area of the site and tramway lines crossed the site along the western area. To the south of the dock were Abercanaid Houses, which consisted of a number of residential properties and rear gardens.

The most southern area of the site was noted as the Upper Abercanaid Pit (Coal), with an Engine and Boiler House located on the south west boundary.

A stream intercepted the site from the central western area and flowed towards the south east of the site into the River Taff. A minor stream or run-off channel intercepted the northern area of the site from the west and flowed in an easterly direction into the River Taff. In areas, the stream flowed below the spoil heaps, presumably within culverts.

To the south of the site were residential properties. To the west and south west of the site was a canal and associated towing path. Woodland areas and open fields with a number of old quarries and old air shafts are also indicated to the south of the site. To the north and north west of the site were colliery spoil heaps. The River Taff was located along the eastern boundary, followed by the Taff Vale Railway.

Numerous old airshafts were located beyond the south west of the site boundary.

3.0 SITE HISTORY (CONTINUED)

By 1900, the majority of the stream that incepted the north of the site, was indicated to flow below the spoil heaps. An Engine House was located in the north west of the site. The spoil heaps in the north and central area of the site were fed by tramlines. Abercanaid Houses had been demolished and replaced with tramlines and spoil heaps. The majority of the stream in the south of the site lay below the spoil heaps and tramlines.

A map dated 1919, shows the engine house and tramlines are no longer indicated. The Upper Abercanaid Pit was noted as disused. The Glamorganshire Canal located to the west of the site was noted as disused. A Gas Works was located some 400m north of the site.

By 1964, the majority of the site remained covered with soil heaps. Allotments were located in the far southern area of the site. The stream in the south of the site indicated to be the Nant Cannaid.

By 1972, the soil heaps were labelled as Tip (disused). A pipe line crossed the south of the site in an east to west trend. Three above ground electricity lines was shown to cross the site. A road entered the site from the north towards a factory that was located immediately to the north west of the site. An area of residential properties was located some 100m to the south west of the site. A factory was located adjacent to the Gas Works some 400m north of the site.

A map dated 1979, shows that the site had been cleared of the colliery spoil heaps and the overhead electricity cables had been removed. A factory was located immediately to the north of the site.

By 1986, buildings were located on site resemble the most recent site layout. The site contained a large building, with a smaller building in the south and west of the site. An above ground tank was located in the north east and two tanks in the west of the site. Off-site a further factory was located immediately to the west of the site.

A map dated 1988, shows the factory to the north of the site had expanded in size. No significant change had occurred on site. By 1997, the factory was known to have been operated by the Ardagh Group for printing of current boards and coating of metal packaging.

By 2006, no significant change had occurred on site. Abercanaid Industrial Estate was located some 250m to the north of the site.

3.0 SITE HISTORY (CONTINUED)

A map dated 2015, indicates that the large factory building and the smaller buildings and tanks in the north east of the site are no longer present. A building remained in the far south and west of the site.

4.0 SITE ENVIRONMENTAL SETTING

4.1 PHYSICAL SETTING

The site is situated on sloping ground that slopes from an approximate elevation of 162m AOD in the east, to 157m AOD in the south.

4.2 GEOLOGY

The 1:10,560 scale geological map of the area (Sheet SO 00 SE) shows the site is underlain by rocks of the South Wales Middle Coal Measures of Carboniferous age. The rocks comprise of mudstone and siltstone with several productive coal seams. The map indicates that these strata dip in a southern direction in the area, with recorded dips of 10 degrees shown to the south of the site.

The map indicates the conjectural outcrops of five coal seams at or near the site. In the southern to central area of the site, outcrops of the Two Feet Nine, Four Feet, Upper Six Feet and Lower Six Feet are indicated to be present. The outcrops of the Nine Feet and Bute seams are indicated to be present in the vicinity of the site northern boundary.

The site is therefore likely to be underlain at shallow depths by all of the above named coal seams. The northernmost part of the site may also be underlain at shallow depths by the Yard and Seven Feet seams, which typically lie some 25 to 30m below the Nine Feet seam.

The generalised vertical section of the geological map shows that all these coal seams have potentially workable seam thickness, as follows:

<u>Coal Seal</u>	<u>Typical Seam Thickness (m)</u>
Two Feet Nine	0.75
Four Feet	1.80
Upper Six Feet	0.90
Lower Six Feet	1.20
Nine Feet	3.65
Bute	1.20
Yard	0.75
Seven Feet	1.20

2.3 GEOLOGY (CONTINUED)

Most of these seams are known to have been mined in the area and each of these seams is likely to underlie part of the site at shallow depths.

The geological map indicates that Alluvium superficial deposits overlie the rock strata in the north and east of the site, while Glacial Till deposits overlie the rock strata in the west of the site.

Made ground is likely to be present over most/all of the site, due to its past industrial development and ground raising.

Previous site investigations undertaken by Intégral Géotechnique near the northern end of the site identified groundwater under sub-artesian pressure within the underlying rock strata of the South Wales Middle Coal Measures.

A review of available historical BGS borehole logs from the surrounding area encountered made ground to a depth of between 2.6 and 5.3m. The made ground was underlain by Glacial Till to a depth of between 7.4 and 15m. The South Wales Middle Coal Measures were proven to 30m below ground level. One borehole encountered the Four Feet coal seam at a depth of 11m and the Upper Six Feet seam at a depth of 25.5m.

A summary of the anticipated geological succession is given below in Table 1.

Table 1 : Summary of Anticipated Site Geology		
Geological unit	Horizon	Description
Recent	Made ground	Various materials
Quaternary	Glacial Till	Sands and gravels with varying matrix
Quaternary	Alluvium	Silt clay with layers of peat, sand and gravel.
Carboniferous	South Wales Middle Coal Measures	Coal bearing mudstones and siltstones with seatearths and minor sandstones.

4.3 RADON

The Envirocheck Report indicates that the site is located in a lower probability area, as less than 1% of homes are above the action level and radon protective measures are not required.

4.4 MINING

A Coal Mining Report for the site has been obtained from the Coal Authority and a copy is included in Appendix A. The report states the following:

- The site is in the likely zone of influence from workings in 3 seams of coal at shallow to 140m depth, and last worked in 1950.
- The site is not in the likely zone of influence of any present underground coal workings.
- The Coal Authority states that within, or within 20m of the boundary of the site, there are seven mine entries. The following information was provided:
 - 305204-038. This shaft was filled grouted and capped in 1975.
 - 305204-030. Information provided to the Coal Authority by British Coal indicated this shaft is filled.
 - 305204-069. No treatment details.
 - 305204-036. This shaft was filled grouted and capped in 1975.
 - 305204-031. This shaft was grouted and capped in 1977.
 - 305204-060. Uncovered during road improvements, we understand this adit was treated by K Wardell and Partners Consultant Mining Engineers.
 - 305204-037. This shaft was filled grouted and capped in 1975.
- The Authority is not aware of any evidence of damage arising due to geological faults or other lines of weakness that have been affected by coal mining.
- The site is not within the boundary of an opencast site from which coal has been removed by opencast methods.
- The Coal Authority has not received a damage notice or claim for the subject property, or any property within 50 metres, since 31st October 1994.
- There is no current Stop Notice delaying the start of remedial works or repairs to the property.

The recorded workings at shallow to 140m depth are thought to be within the Seven Feet, Nine Feet and Four Feet coal seams.

2.4 MINING (CONTINUED)

As discussed earlier, the geological map of the area indicates that several coal seams, each with potentially workable seam thickness are likely to underlie the site at shallow depths, and there is a possibility of unrecorded as well as recorded shallow workings being present in many of these seams.

Wherever old workings underlie the site at shallow depths and are still uncollapsed, or only partially collapsed, there may be an associated risk of ground subsidence occurring and affecting the site surface.

Boreholes would need to be drilled across the site to locate and investigate the thicknesses and depths of the various underlying seams, in order to assess the potential associated risks of mining related ground subsidence.

The level of any associated potential ground subsidence risk will depend on the thickness and extent of any remnant voids and also whether there is sufficient overlying rock cover to prevent any associated remnant uncollapsed voids migrating up to the site's surface.

A Coal Mining Risk Assessment report (Ref 11708/LW/16/CMRA) has been produced. Reference should be made to this report for more information on mining risk.

4.5 HYDROLOGY, HYDROGEOLOGY AND FLOOD RISK

The River Taff is located along the eastern site boundary and flows in a southern direction. The Nant Canaid could still be present in a culvert beneath the southern part site, flowing west to east.

The Environment Agency groundwater vulnerability map and aquifer database classifies the bedrock and superficial deposits (Alluvium) beneath the site as a Secondary 'A' Aquifer. Secondary 'A' Aquifers are permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers. These are generally aquifers formerly classified as minor aquifers

The Environment Agency groundwater vulnerability map and aquifer database classifies the superficial deposits consisting of Glacial Till beneath the west of the site as Unproductive Strata. Unproductive strata are rock layers or drift deposits with low permeability that have negligible significance for water supply or river base flow.

4.5 HYDROLOGY, HYDROGEOLOGY AND FLOOD RISK (CONTINUED)

A perched water body may be anticipated in the made ground. Vertical migration of groundwater is likely to be limited by the high clay content of the glacial till and alluvium. It is considered possible that the existing site drainage can act as a pathway for potential surface contaminants.

The Envirocheck Report states that there are five discharge consents within 500m of the site. The nearest was located 60m to the south east for the discharge of trade effluent into the River Taff. The consent has expired.

The Envirocheck Report states that there are three water abstractions within 500m of the site. The nearest is located 221m to the north west, where surface water can be extracted from a single point.

Tables 2 and 3 present a summary of the hydrological features and key hydrogeological nature of the site.

Table 2: Summary of Site Hydrology					
Feature	Distance from site	Flow	Classification	Abstraction	Discharge
Nant Cannaid	On site (possibly below site in a culvert)	East	Not known	No	River Taff
River Taff	Immediately east of the site	South	Not known	No	Bristol Channel
Surface run-off	On site	Flows into site drainage	N/A	No	Not known
Site Drainage	On site	Not known	N/A	No	Not known

It is recommended that a survey of the culverts underlying the site is obtained in order that the potential development constraint is quantified. Note that the approximate path of an extended culvert is shown on Figure 2.

4.5 HYDROLOGY, HYDROGEOLOGY AND FLOOD RISK (CONTINUED)

Table 3: Summary of Site Hydrogeology				
Geological Unit	Aquifer Classification	Aquifer Characteristics	Source Protection Zone	Groundwater Abstractions
Made ground	Not classified	Highly variable permeability and porosity. Perched water may be present with variable flow directions.	No	None
Glacial Till	Unproductive Strata	Variable moderate permeability and porosity with intergranular flow possible. High clay content likely to restrict flow.	No	None
Alluvium	Secondary A Aquifer	Variable permeability generally low silty clay with peat, sand and gravel layers.	No	None
South Wales Middle Coal Measures	Secondary A Aquifer	Variable permeability generally low mudstone/siltstone and coals	No	None

The soils have been classified as having a low leachate potential. Soils of low leaching potential are unlikely to penetrate the soil layer because either water movement is largely horizontal, or they have the ability to attenuate diffuse pollutants. Lateral flow from these soils may contribute to groundwater recharge elsewhere in the catchment.

The Environment Agency Flood Risk Map as presented within the Envirocheck Report in Appendix A indicates that the majority of the site is at risk of flooding from rivers without defences. The northern area of the site is not indicated to be at risk of flooding from rivers. The Environment Agency Flood Risk Map for flooding from surface water indicates that the northern reaches of the site are also at risk of flooding. The combined effect for both flood maps is that almost the entire site is at risk of flooding.

4.6 LANDFILL SITES

The Envirocheck Report indicates that there is one landfill located within 1.0km of the site. This registered landfill site was located 794m to the south east of the site and authorised to accept excavated natural materials.

The Envirocheck Report indicated that there are no BGS recorded landfills, historic landfills or local authority landfills within 1.0km of the site.

4.7 POTENTIAL CONTAMINATION

Previous Uses

The various activities in the vicinity of the site which may have resulted in ground or water resource contamination on this site are listed below in Tables 4 and 5. Reference to Department of the Environment Industry Profiles has been made and a summary of the potential contaminants can be found in the tables.

4.7 POTENTIAL CONTAMINATION (CONTINUED)

Table 4: Potential Contaminants		
Land Use: colliery spoil tips/ coal mining and docks 1800s to 1970s		
Material/Process	Contamination/Hazard	Evidence
Colliery tips/stockpiles with engine and boiler house	Metals, semi metals, non-metals, PAH, hydrocarbons, asbestos.	Historical Maps
Tram / Railway line	Metals, semi metals, non-metals, PAH, hydrocarbons, asbestos.	Historical Maps
Canal Dock	Metals, semi metals, non-metals, PAH, hydrocarbons.	Historical Maps
Land Use: factory 1980s to present day		
Material/Process	Contamination/Hazard	Evidence
Imported made ground/earthworks/construction of former buildings.	Metals, semi metals, non-metals, PAH, asbestos.	Historical Maps/ site walkover
Above ground and in ground storage tanks	Hydrocarbons – Fuels.	Historical Maps
Light industrial uses including printing of circuit surfaces and coating of metal packaging.	Metals, Non-metals, Semi-Metals, PAH, PCBs, VOCs, SVOCs.	Contemporary Trade Directory
Potential Underground Storage Tanks	Hydrocarbons – Fuels.	Historical Maps

Existing Uses

It is understood that operations on site have ceased and buildings have been demolished to slab level.

4.7 POTENTIAL CONTAMINATION (CONTINUED)

Adjacent Site Uses

Table 5 : Potential Contaminants : Adjacent Site Uses		
Potential Contamination Source	Boundary	Associated Contaminants and Hazards
Residential	Southern and south western	No Significant Contaminants
Woodland	Western	No Significant Contaminants
Commercial / industrial	Northern	Metals, semi metals, non-metals, PAH, hydrocarbon and asbestos
River Taff	Eastern	No Significant Contaminants

4.8 OTHER ENVIRONMENTAL ISSUES

The Envirocheck Report identified environmentally sensitive land located 312m to the north west of the site. Natural Resources Wales has designated the land, known as Cwm Glo a Glyndyrys as a Site of Special Scientific Interest in 2003.

The Envirocheck Report indicates that there have been three recorded pollution incidents to controlled waters onsite.

In 1994, a Category 1 – Major Incident was recorded involving direct discharge of cement/mortar. The cause of pollutant was due to poor operational practice. The receiving water was not given.

In 1994, a Category 3 - Minor Incident was recorded involving direct discharge of crude sewage. The receiving water was not given.

In 1994, a Category 3 - Minor Incident was recorded involving direct discharge of crude sewage. The receiving water was not given. The cause of pollutant was due to poor operational practice.

There have been a further 16 recorded pollution incidents to controlled waters within 1.0km of the site. The nearest was located 136m to the north of the site. The incident was recorded as a Category 2 – Significant Incident, involving crude sewage in 1994. The receiving water is not given

4.8 OTHER ENVIRONMENTAL ISSUES (CONTINUED)

The Envirocheck Report indicates that there have been no prosecutions relating to authorised processes or controlled waters within 1.0km of the site.

5.0 PRELIMINARY CONCEPTUAL SITE MODEL

5.1 RISK ASSESSMENT FRAMEWORK

In order to be consistent with current UK government policies and legislation, it is necessary to identify, make decisions on, and take appropriate action to deal with land contamination, in accordance with the procedures specified in the Environment Agency document 'Model Procedures for the Management of Land Contamination CLR-11' (Environment Agency 2004).

The risk assessment process is designed to provide a reasoned, structured and pragmatic mechanism for the identification of any potential human health and controlled waters risks associated with land contamination and where necessary to develop a robust remediation strategy to ensure protection of the sensitive receptors (human health of future residents, controlled waters, etc.).

In accordance with the CLR-11 framework, risk is defined as:

'a combination of the probability, or frequency, of occurrence of a defined hazard and the magnitude of the consequence of the occurrence'.

The three essential elements to any risk are defined by CLR-11 as follows:

- A contaminant, or hazard, which is in, on, or under the land and has the potential to cause harm (Source)
- A means by which a receptor can be exposed to, or affected by a contaminant or hazard (Pathway)
- A receptor, i.e. something which could be adversely affected by a contaminant or hazard, such as human health or groundwater (Receptor).

In order for there to be a potential risk, all three of the above elements must be present. If there is a source of contamination and a receptor (for example a resident or site user), then there is only a potential risk if there is a pathway linking the two. Such an active pathway is known as a relevant pollutant linkage. It is possible for the same contaminant to be linked to a receptor via a number of pathways, and hence it is important that all relevant pollutant linkages, to both human health and controlled waters, are separately identified on a site in order that a comprehensive conceptual model can be formed and ultimately a robust remediation strategy designed.

5.1 RISK ASSESSMENT FRAMEWORK (CONTINUED)

Current practice during Generic Quantitative Risk Assessment of land affected by contamination is to use generic soil screening values based on the appropriate proposed end use. These usually comprise risk based Soil Guideline values (SGVs) or Generic Assessment Criteria (GACs) derived by the Environment Agency's Contaminated Land Exposure Assessment Model (CLEA). The SGVs and the supporting technical guidance were developed to in order to assist in the assessment of long term risk to human health from the exposure to contaminated soils.

Revised Statutory Guidance, published in 2012, to support Part 2A of the Environmental Protection Act 1990, introduced a new four category system for classifying land under Part 2A. Category 1 includes land where the level of risk is clearly unacceptable and Category 4 includes land where the level of risk posed is considered to be acceptably low. Under Part 2A, land would be determined as contaminated if it falls within Categories 1 or 2.

The revised Part 2A Statutory Guidance was accompanied by an Impact Assessment that identified a role for new 'Category 4 Screening Levels' (C4SLs) that would provide a simple test for determining when land is suitable for use and definitely not contaminated land. A Policy Companion Document including the C4SLs was published in March 2014 (England) and May 2014 (Wales).

The C4SLs have been based on the CLEA methodology and derived using the CLEA model, with modified toxicological and exposure parameters. To date, C4SLs have been released for six substances (arsenic, cadmium, chromium (VI), lead, benzo(a)pyrene and benzene).

The C4SLs have been derived on the assumption that where they exist, they will be used as generic screening criteria within generic quantitative risk assessment.

Following publication of the C4SLs, Land Quality Management (LQM), in conjunction with the Chartered Institute for Environmental Health (CIEH) released Suitable 4 Use Levels (S4ULs) in January 2015.

The S4ULs have been derived in accordance with UK legislation, and using a modified version of the Environment Agency's CLEA software. As such, the S4ULs are based on the concept of minimal or tolerable risk as described in Human Health Toxicological Assessment of Contaminants in Soil (Science Report SR2, Environment Agency 2009a).

S4ULs have been derived for a wider number of substances.

5.1 RISK ASSESSMENT FRAMEWORK (CONTINUED)

In addition to the existing SGVs, C4SLs and S4ULs, Atkins ATRISK^{soil} also provide a set of Soil Screening Values. These are currently intended to be used in conjunction with SGVs, although they intend to update these values in line with the C4SLs in due course.

We have reviewed all sets of values and intend to use the most appropriate assessment criteria as Tier 1 screening values in the first instance. Where a published C4SL is available, and considered appropriate, this will be used in the first instance.

5.2 CONCEPTUAL MODEL FRAMEWORK

The preliminary stage of the risk assessment process is to develop and define a conceptual site model, based on the desk study and any existing site investigation data. This is used to establish any potential contaminant sources, identify existing and future receptors and assess if there are any potentially active pathways by which a potential risk may be present.

The preliminary conceptual site model will be developed and refined as site specific data is gathered, such as actual ground conditions and chemical data, resulting in a more robust conceptual understanding of the site.

5.3 CRITICAL SENSITIVE RECEPTOR – HUMAN HEALTH

The proposed redevelopment of the site is for a mixture of residential and commercial end use. Therefore, the critical sensitive receptor from a human health perspective is an on-site residential receptor.

In accordance with C4SL and CLEA guidance for a standard mixed residential and commercial scenario, the critical sensitive receptor for a residential end use risk assessment is a female child, with exposure from 0 to 6 years.

The standard mixed residential and commercial end use conceptual model defined by C4SL and CLEA is assumed to be suitable for the purposes of this assessment.

5.4 CRITICAL SENSITIVE RECEPTOR – CONTROLLED WATERS

Based on the proposed redevelopment of the site for a mixed residential and commercial end use, and the findings of the desk study, the critical sensitive receptor from a controlled water perspective is groundwater within the Secondary 'A' Aquifer of the South Wales Middle Coal Measures, at the southern boundary of the site.

5.4 CRITICAL SENSITIVE RECEPTOR – CONTROLLED WATERS (CONTINUED)

By considering groundwater as the critical sensitive receptor for controlled waters, the groundwater/hydrogeological risk assessment will also be protective of the River Taff to the east of the site.

5.5 POTENTIAL CONTAMINANT SOURCES

As identified in the desk study, the extensive historical land uses at the site since the 1800's has resulted in a list of potentially contaminative uses that include the stockpiling of colliery waste and surface workings of the underground mine and later a factory for printing, metal packaging and production of cargo restraints. There is evidence of above ground storage tanks being present on site.

The potential types of contaminants of concern are listed below:

- Metals, semi-metals, and inorganics within the shallow made ground
- Polyaromatic hydrocarbons (PAH) within the shallow made ground
- Polychlorinated biphenyl (PCB) within shallow made ground
- Petroleum Hydrocarbons (VPH/EPH), Volatile Organic Compounds (VOCs) and Semi Volatile Organic Compounds (SVOCs) within the shallow made ground and possible underground storage tanks
- Asbestos within the shallow made ground.

5.6 POTENTIAL EXPOSURE PATHWAYS

Potential exposure pathways for the critical receptors (both human health and controlled waters) are listed below:

- Dermal contact with soil and/or soil derived dust
- Ingestion of soil and/or soil attached to home-grown produce
- Ingestion of home-grown produce
- Inhalation of soil derived dust
- Inhalation of vapours – indoor and outdoor air
- Leaching of contaminants from made ground to groundwater
- Transportation of contaminants within groundwater.

In addition, the following exposure pathways have also been considered:

- Ground gas generation and migration
- Building materials durability.

5.7 SUMMARY OF CONCEPTUAL EXPOSURE MODEL

A preliminary conceptual exposure model has been developed for the site. This is based on the findings of the desk study and historical review and includes all potential sources, pathways and receptors that may be present on site. Those that have been identified as being potentially active require further investigation in the form of sampling and testing of soils and groundwater, followed by appropriate risk assessment.

The preliminary conceptual exposure model will be reviewed and refined following the completion of the site works and laboratory testing.

The preliminary conceptual exposure model is presented below in Table 6.

5.7 SUMMARY OF CONCEPTUAL EXPOSURE MODEL (CONTINUED)

Table 6: Preliminary Conceptual Exposure Model				
Source		Receptor	Pathway	Potentially Active Pathway?
Origin	Contaminant			
Made Ground of unknown origin and historical land uses	Metals, semi-metals, non-metals, PAH, petroleum hydrocarbons, Asbestos	Resident – human health	Dermal Contact with made ground/dust	✓
			Ingestion of soil and/or soil attached to home-grown produce	✓
			Ingestion of home-grown produce	✓
			Inhalation of dust	✓
			Inhalation of vapours – indoor/outdoor	✓
	Metals, semi-metals, inorganics, PAH, petroleum hydrocarbons.	Groundwater quality	Leaching from made ground	✓
	Metals, semi-metals, inorganics, PAH, petroleum hydrocarbons.	Surface water quality	Transportation within groundwater	✓
Above ground and in ground storage tanks	Petroleum hydrocarbons	Resident – human health	Inhalation of Vapours – indoor/outdoor	✓
	Petroleum hydrocarbons	Groundwater quality	Localised spillage	✓
	Petroleum hydrocarbons	Surface water quality	Transportation within groundwater	✓
Made Ground of unknown origin and natural ground	pH and sulphates	Building Materials Durability	Direct contact	✓
Ground Gas – organic, gas producing materials	Methane, carbon dioxide	Human health	Accumulation of gases in confined spaces, and/or migration off site, leading to asphyxiation, or risk of explosion	✓

6.0 ANTICIPATED GROUND CONDITIONS

Based on the geological map data and historical records, the general succession of superficial deposits and underlying solid geology beneath the site is anticipated as follows:

Recent	Potentially widespread made ground associated with demolition of former buildings and raising of site levels.
Quaternary	Alluvium. These deposits are expected to consist of silty clay with layers of sand, peat and gravel.
Quaternary	Glacial Till (far west of the site). These deposits are expected to comprise clay, silt, sands and gravels with varying cobble and boulder content.
Carboniferous	Solid strata of the South Wales Middle Coal Measures, typically comprising coal bearing mudstones and siltstones with seatearths and minor sandstones.

7.0 SITE ASSESSMENT

7.1 ENVIRONMENTAL RISK ASSESSMENT

This assessment takes due regard of Contaminated Land Guidance issued by DEFRA and RICS. The methods used follow a risk based approach with the potential environmental risk assessed qualitatively using the 'source-pathway-receptor' pollutant linkage concept set out in the Environment Protection Act 1990.

Although the risk presented in the following tables and above is descriptive, it is correlated to a numerical chance of occurrence. Therefore, the range and percentage chance of occurrence is given in order that the reader may assess the datum for the risk level. Although the percentage chance is quoted, this is still a subjective evaluation and is not prepared by probabilistic determination. Therefore, the chance of occurrence is a value judgement and not a numerical calculation. The evaluation is a simple qualitative risk assessment, which cannot make a judgement as to the probability of occurrence or the level of contamination that occurs. The latter two aspects require detailed site specific information.

Reference to risk classifications is made according to the following definitions.

Low Risk	It is unlikely that the issue will arise as a liability/cost.
Medium Risk	It is possible that the issue could arise as a liability/cost. Further work is needed to clarify the risk and consequences.
High Risk	It is likely that the issue will arise as a liability/cost.

In consideration of the information gathered and presented in this report the following risk appraisal is considered appropriate.

7.1 ENVIRONMENTAL RISK ASSESSMENT (CONTINUED)

Table 7: Environmental Risk Assessment		
Issue	Risk Category	Comments
Site sensitivity		
Sensitivity of site location	Low	Site is not within a 'groundwater source protection zone' a 'nitrate vulnerable zone', or an 'area of outstanding natural beauty'.
Environmental sensitivity of adjacent land uses	Medium	Site situated adjacent to River Taff, commercial properties and residential dwellings.
Contamination potential		
Potential for significant on-site contamination	Medium	- Potential areas of made ground / disturbed ground associated with the construction / demolition of the former buildings and raising of site levels. - Fuel / tank spillages.
Potential for contaminants migrating off from the site	Medium	
Potential for contaminants migrating onto the site	Low/Medium	
Potential for other environmental issues to give rise to liabilities	Medium	
Environmental Consequences		
Risk of pollution of controlled waters	Medium	- Potential leachate generation within made ground/ disturbed ground. - Potential asbestos in soils. - Potential ground gas generation within made ground.
Risk of damage to future property	Medium	
Risk of harm to human health	Medium/High	
Business Consequences		
Risk of liability for owner	Medium	Former industrial uses may give rise to significant contamination concerns.
Likelihood of designation as Contaminated Land under EPA 1990	Low/Medium	
Risk of site value and/or saleability being affected	Medium/High	
Overall Risk	Medium/High	

7.2 GEOTECHNICAL HAZARDS AND CONSTRAINTS

A summary of commonly occurring geotechnical hazards is given in Table 8, together with an assessment of whether the site may be affected by each of the stated hazards.

Table 8: Summary of Potential Geotechnical Hazards				
Issue (excluding contamination issues)	Hazard Status			Engineering considerations
	Likely to be present on site	Could be present on site	Unlikely to be present and/or affect the site	
Shrinkable clays		✓		Special requirements for foundation and floor design Likely to affect ground engineering and foundation design and construction.
Filled and made ground	✓			
Highly compressible and low bearing capacity soils including peat and soft clay		✓		
Silt rich soils susceptible to rapid loss of strength in wet conditions		✓		
Adverse ground chemistry (including expansive slags, weathering of sulphides to sulphates)		✓		
Combustibility potential		✓		
Solution features			✓	
Evaporite dissolution features and subsidence			✓	
Ground subject to peri-glacial valley cambering with gulls present		✓		
Sudden lateral changes in ground conditions		✓		
Existing sub structures (e.g. foundations and pits)	✓			
Ground subject to vibration			✓	
Underground mining (shallow)	✓			
Mine entries (shafts and adits, bell pits)	✓			
Ground subject to or at risk of coastal or river erosion		✓		
Ground subject to, or at risk from landslips			✓	
High water table (including waterlogged ground)		✓		May affect temporary and permanent works
Rising groundwater table due to diminishing abstraction in urban areas or cessation of deep mining		✓		

7.2 GEOTECHNICAL HAZARDS AND CONSTRAINTS (CONTINUED)

Table 8: Summary of Potential Geotechnical Hazards (CONTINUED)				
Issue (excluding contamination issues)	Hazard Status			Engineering considerations
	Likely to be present on site	Could be present on site	Unlikely to be present and/or affect the site	
Culverted water courses	✓			May constraint development

Together with the geotechnical hazards outlined in Table 8, consideration should also be given the following site constraints:

Site Preparation Considerations:-

Allowances should be made for encountering buried structures associated with the former buildings including foundations, tanks, sumps, flues, basements etc.

Allowances should also be made for encountering active and redundant services and drainage.

Earthworks Considerations:-

Depending of the thickness of made ground, allowances should be made for minor earthworks for the removal or reuse of the made ground in order to create a suitable development surface.

8.0 SITE INVESTIGATION PROPOSALS

If it was planned to re-develop the site, in order to facilitate a detailed technical and financial appraisal, a comprehensive intrusive site investigation would be required. This would enable the foundation and hardstanding design for any proposed development to be developed using specific data on the ground conditions and enable more accurate costings to be made.

Investigation works should give consideration to the following:

- Foundation design
- Excavation stability design
- Remediation requirements
- Groundwater control

In particular, the principal geoenvironmental and geotechnical issues to be addressed are:

- Foundation strata - level, strength, compressibility, and chemical characteristics'
- Presence or absence of shrinkable clays,
- The extent of any ground contamination,
- The potential for ground gas to be present beneath the site.

Investigation techniques to be adopted should include:

- Trial pitting or dynamic windowless sampling and in situ testing to examine the ground conditions, including soil and groundwater, at shallow depths.
- Laboratory chemical testing to determine soil characteristics and properties, and chemistry to include a range of organic and inorganic contaminants.
- Laboratory geotechnical testing to assess the potential degree of volume change of any cohesive materials which might underlie the site and to assess the potential for aggressive ground conditions in accordance with BRE:SD1 (2005).
- Rotary boreholes to investigate the extent of shallow coal seams and underground workings beneath the site and to assess the mining risk and any required remedial works.
- Gas monitoring to check for land gasses

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Glamorganshire

Published 1881

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Historical Aerial Photography

Published 1945

Source map scale - 1:10,560

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2015

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Date we received your enquiry: **12 January 2016**
Date of issue: **12 January 2016**

This report is for the property described in the address below and the attached plan.

Non-Residential Coal Authority Mining Report

UNIT A, ABERCANAID, DRAGON PARC MERTHYR TYDFIL,

This report is based on and limited to the records held by, the Coal Authority, and the Cheshire Brine Subsidence Compensation Board's records, at the time we answer the search.

Coal mining	See comments below
Brine Compensation District	No

Information from the Coal Authority

Underground coal mining

Past

The property is in the likely zone of influence from workings in 3 seams of coal at shallow to 140m depth, and last worked in 1950.

Present

The property is not in the likely zone of influence of any present underground coal workings.

Future

The property is not in an area for which the Coal Authority is determining whether to grant a licence to remove coal using underground methods.

The property is not in an area for which a licence has been granted to remove or otherwise work coal using underground methods.

The property is not in an area that is likely to be affected at the surface from any planned future workings.

However, reserves of coal exist in the local area which could be worked at some time in the future.

No notice of the risk of the land being affected by subsidence has been given under section 46 of the Coal Mining Subsidence Act 1991.

Mine entries

Within, or within 20 metres of, the boundary of the property there are 7 mine entries, the approximate positions of which are shown on the attached plan.

Our records disclose the following information:

305204-038. This shaft was filled grouted and capped in 1975..

305204-030. Information provided to the Coal Authority by British Coal indicates th is shaft is filled.

305204-069. No treatment details.

305204-036. This shaft was filled grouted and capped in 1975..

305204-031. This shaft was grouted and capped in 1977..

305204-060. Uncovered during road improvements we understand this adit was treated by K Wardell and Partners Consultant Mining Engineers..

305204-037. This shaft was filled grouted and capped in 1975..

Records may be incomplete. Consequently, there may exist in the local area mine entries of which the Coal Authority has no knowledge.

For an additional fee, the Coal Authority will provide a supplementary Mine Entry Interpretive Report. The report will provide a separate assessment for the mine entry (entries) referred to in this report. It will give details based on information in the Coal Authority's possession, together with an opinion on the likelihood of mining subsidence damage arising from ground movement as a consequence of the existence of the mine entry/entries. It will also give details of the remedies available for subsidence damage where the mine entry was sunk in connection with coal mining.

Please note that it may not be possible to produce a report if the main building to the property cannot be identified from Coal Authority plans (ie. for development sites and new build).

For further advice on how to order this additional information visit www.groundstability.com or telephone 0345 7626 848.

Coal mining geology

The Authority is not aware of any evidence of damage arising due to geological faults or other lines of weakness that have been affected by coal mining.

Opencast coal mining

Past

The property is not within the boundary of an opencast site from which coal has been removed by opencast methods.

Present

The property does not lie within 200 metres of the boundary of an opencast site from which coal is being removed by opencast methods.

Future

The property is not within 800 metres of the boundary of an opencast site for which the Coal Authority is determining whether to grant a licence to remove coal by opencast methods.

The property is not within 800 metres of the boundary of an opencast site for which a licence to remove coal by opencast methods has been granted.

Coal mining subsidence

The Coal Authority has not received a damage notice or claim for the subject property, or any property within 50 metres, since 31st October 1994.

There is no current Stop Notice delaying the start of remedial works or repairs to the property.

The Authority is not aware of any request having been made to carry out preventive works before coal is worked under section 33 of the Coal Mining Subsidence Act 1991.

Mine gas

There is no record of a mine gas emission requiring action by the Coal Authority within the boundary of the property.

Hazards related to coal mining

The property has not been subject to remedial works, by or on behalf of the Authority, under its Emergency Surface Hazard Call Out procedures.

Withdrawal of support

The property is not in an area for which a notice of entitlement to withdraw support has been published.

The property is not in an area for which a notice has been given under section 41 of the Coal Industry Act 1994, revoking the entitlement to withdraw support.

Working facilities orders

The property is not in an area for which an Order has been made under the provisions of the Mines (Working Facilities and Support) Acts 1923 and 1966 or any statutory modification or amendment thereof.

Payments to owners of former copyhold land

The property is not in an area for which a relevant notice has been published under the Coal Industry Act 1975/Coal Industry Act 1994.

Comments on Coal Authority information

The attached plan shows the approximate location of the disused mine entry/entries referred to in this report. For reasons of clarity, mine entry symbols may not be drawn to the same scale as the plan.

Property owners have the benefit of statutory protection (under the Coal Mining Subsidence act 1991*). This contains provision for the making good, to the reasonable satisfaction of the owner, of physical damage from disused coal mine workings including disused coal mine entries. A leaflet setting out the rights and the obligations of either the Coal Authority or other responsible persons under the 1991 Act can be obtained by telephoning 0345 762 6848.

If you wish to discuss the relevance of any of the information contained in this report you should seek the advice of a qualified mining engineer or surveyor. If you or your adviser wish to examine the source plans from which the information has been taken these are normally available at our Mansfield office, free of charge, by prior appointment, telephone 01623 637225. Should you or your adviser wish to carry out any physical investigations that may enter, disturb or interfere with any disused mine entry the prior permission of the owner must be sought. For coal mine entries the owner will normally be the Coal Authority.

The Coal Authority, regardless of responsibility and in conjunction with other public bodies, provide an emergency call out facility in coalfield areas to assess the public safety implications of mining features (including disused mine entries). Our emergency telephone number at all times is 01623 646333.

*Note, this Act does not apply where coal was worked or gotten by virtue of the grant of a gale in the Forest of Dean, or any other part of the Hundred of St. Briavels in the county of Gloucester.

In view of the mining circumstances a prudent developer would seek appropriate technical advice before any works are undertaken.

Therefore if development proposals are being considered, technical advice relating to both the investigation of coal and former coal mines and their treatment should be obtained before beginning work on site. All proposals should apply good engineering practice developed for mining areas. No development should be undertaken that intersects, disturbs or interferes with any coal or mines of coal without the permission of the Coal Authority. Developers should be aware that the investigation of coal seams/former mines of coal may have the potential to

generate and/or displace underground gases and these risks both under and adjacent to the development should be fully considered in developing any proposals. The need for effective measures to prevent gases entering into public properties either during investigation or after development also needs to be assessed and properly addressed. This is necessary due to the public safety implications of any development in these circumstances.

Information from the Cheshire Brine Subsidence Compensation Board

The property lies outside the Cheshire Brine Compensation District.

Additional Remarks

Information provided by the Coal Authority in this report is compiled in response to the Law Society's Con29M Coal Mining and Brine Subsidence Claim enquiries. The said enquiries are protected by copyright owned by the Law Society of 113 Chancery Lane, London WC2A 1PL. Please note that Brine Subsidence Claim enquiries are only relevant for England and Wales. This report is prepared in accordance with the Law Society's Guidance Notes 2006, the User Guide 2006 and the Coal Authority and Cheshire Brine Board's Terms and Conditions applicable at the time the report was produced.

The Coal Authority owns the copyright in this report. The information we have used to write this report is protected by our database right. All rights are reserved and unauthorised use is prohibited. If we provide a report for you, this does not mean that copyright and any other rights will pass to you. However, you can use the report for your own purposes.
