NON-TECHNICAL SUMMARY

A preliminary ecological assessment was undertaken of land at Plantation Square, Troedyrhiw, Merthyr Tydfil. This report was produced in order to support two applications, one for the refurbishment of the existing dwelling and the second for the erection of a dwelling within the garden of the property.

The work involved a phase 1 habitat survey to categorise the habitats present, an assessment of the site's ability to provide suitable habitats for protected species and recommendations for further survey and actions if considered necessary.

The habitats on site comprise a building, scrub and semi-improved grassland. There is Japanese knotweed present on site.

The building was classed as being suitable for roosting bats. The building was deemed to be of moderate potential and further surveys were undertaken. The building was not identified as a bat roost but bats were identified foraging and commuting through the site.

There is no vegetation on site suitable for dormice. Dormice are not known in the locality. The boundaries of the site will remain in situ.

There were no ponds on or immediately adjacent to the site which could be suitable for use by breeding great crested newts (or other amphibians). It is unlikely that great crested newts will be affected by the proposals.

No evidence of badger activity was recorded within or immediately adjacent to the site boundary. It is possible that badgers will use the site for foraging, however, no evidence of badger was found throughout. It is unlikely that badgers will use the site for sett building due to lack of evidence at the site.

There is no suitable breeding bird habitat on site. It is unlikely that the site will be used by ground nesting species due to disturbance and the small size of the site.

The site provides reptiles with potential habitat for foraging, basking and sheltering purposes, particularly around the interface of the site. There may be some limited hibernation habitat in the rubble piles on the site. Reptile surveys were undertaken and the presence of slow worm was established on site.

1 INTRODUCTION

1.1 OBJECTIVE

The objectives of this report are to:

- identify the habitats present on the site;
- identify the potential for protected species to be present on site;
- using the information gathered to determine whether there may be any impacts (both positive and negative) on protected species present;
- provide recommendations for further survey as necessary; and
- suggest outline mitigation and enhancement ideas and principles

1.2 METHODOLOGY

To achieve the objectives set out above, the following actions were taken:

- Field based assessments in respect of
 1. Habitats;
 2. Protected species, primarily:
 - i. Bats;
 - ii. Dormice;
 - iii. Otters;
 - iv. Amphibians (particularly great crested newt);
 - v. Badgers
 - vi. Reptiles; and
 - vii. Breeding birds

The impact assessment has been undertaken by ecological feature rather than by section i.e. each subject is discussed and assessed separately and summarised in conjunction with the others.

1.3 SITE DESCRIPTION

The red line development site boundary is located on land at 20 Plantation Square, Troedyrhiw, Merthyr Tydfil.

The cottage is a stone built cottage beneath a slate roof. There is a small single storey lean-to extension on the northern elevation. There is a small slate roofed porch on the south.

The cottage is sat within an overgrown garden. There are mature trees to the southern boundary. There are some self seeded trees present within the middle of the site. The garden has been left unmanaged resulting in it becoming overgrown over time.

There is relatively good connectivity via the southern boundary to the wider landscape that comprises of fields delineated by mature hedgerows and patches of broad-leaved woodland.

1.5 STUDY AREA

The field survey looked at the red line development area itself and up to 20m from the site boundaries wherever possible.

2 REGULATORY FRAMEWORK

2.1 INTERNATIONAL

The Conservation of Habitats and Species Regulations 2017 known as the “Habitats Regulations” transpose the Council Directive 92/43/EEC on the Conservation of Natural Habitats and of Wild Fauna and Flora (the Habitats Directive) into UK law. The Directive is the means by which the European Union meets its obligations under the [Bern Convention](#). The most vulnerable and rarest of species are afforded protection under this legislation. The species listed on Schedule 2 of the Habitats Regulations are termed “European Protected Species” and are afforded the highest levels of protection and command strict licensing requirements for any works which may affect them. The species include all British bats, Otter, Dormouse and Great Crested Newt. They are fully protected against disturbance, killing, injury or taking. In addition, any site regarded as their “breeding site or resting place” is also protected. It is generally regarded that the site is protected whether the animals are present or not.

The Habitats Regulations clearly outline the role of Planning Authorities in the implementation of the Habitats and Birds Directives; by stating [Section 10]

10.—(1)a competent authority must take such steps in the exercise of their functions as they consider appropriate to secure the objective in paragraph (3), so far as lies within their powers.

(3) The objective is the preservation, maintenance and re-establishment of a sufficient diversity and area of habitat for wild birds in the United Kingdom, including by means of the upkeep, management and creation of such habitat, as appropriate, having regard to the requirements of Article 2 of the new Wild Birds Directive (measures to maintain the population of bird species).

Habitats Regulations Licensing

Where works will affect a protected species, then a protected species licence may be required and would need to be obtained prior to undertaking the works. The licence can only be issued if the “3 tests” are satisfied, these are:

Test 1 – the purposes of “preserving public health or safety, or for reasons of overriding public interest, including those of a social or economic nature and beneficial consequences of primary importance for the environment”.

Test 2 – there must be “no satisfactory alternative”; and

Test 3 – the derogation is “not detrimental to the maintenance of the population of the species concerned at a favourable conservation status in their natural range”.

Licences are issued by Natural Resources Wales (NRW), with NRW assessing Test 3, and the Local Planning Authority assessing tests 1 & 2 (where proposals are not subject to planning, then NRW alone will assess all three tests). Where Planning regulations apply, the NRW will only issue a licence after determination of the planning application. The 3 tests must also be assessed at the planning determination stage.

2.2 NATIONAL (UK)

The Wildlife and Countryside Act 1981 (As Amended)

The WCA protects the UK's most vulnerable and rare species as outlined below.

Section 1 – breeding birds.

The basic protection afforded to all birds is:

- *Protection from killing, injury or taking of any wild bird*
- *Protection from taking, damaging or destroying the nest of any wild bird*
- *Protection from taking or destroying the egg of any wild bird*

Birds listed on Schedule 1 of the Act are afforded extra levels of protection:

- *Disturbance whilst nest building,*
- *Whilst at or near a nest with eggs or young,*
- *Disturbing the dependant young of such a bird.*
- There are exemptions from this basic protection for, for example: sale, control of pest species and sporting eg. game birds outside of the close season; development is not considered an exemption.
- **Section 9 (Schedule 5) - protected animals (other than birds)**
- All animals listed on Schedule 5 are protected against killing, injury or taking. Any structure/place used for shelter or protection is protected against damage, destruction or obstructing access to. It is also an offence to disturb an animal whilst using such a structure / place. Some species such as the more widespread species of reptiles (slow worm, common lizard, adder and grass snake) are afforded "Part Protection" meaning that only some of the protection outlined above applies – eg the animals may be protected from killing/injury, but not their structure used for shelter/protection.
- **Section 13 (Schedule 8) – protected plants.**
- Protected plants are protected from: being picked, uprooted or destroyed, sale and advertising for sale.

THE PROTECTION OF BADGERS ACT 1992

Badgers are protected from killing, injury and taking; or attempting to kill, injure or take. Badger setts are also afforded protection and it is an offence to:

- *Damage a badger sett or any part of it*
- *Destroy a badger sett*
- *Obstruct access to any entrance of a badger sett*
- *Disturb a badger when it is occupying a badger sett*

Development which will destroy or disturb a badger sett (within 30m) is subject to licensing; by NRW.

2.3 NATIONAL (WALES)

PLANNING POLICY WALES (EDITION 12, FEBRUARY 2024)

6.2.8 The role of development as part of a spatial approach will be two fold. Planning authorities firstly must ensure that development avoids and then minimises impact on biodiversity and ecosystems and secondly that it provides opportunities for enhancement within areas identified as important for the ability of species to adapt and/or to move to more suitable habitats.

6.2.9 Planning authorities must encourage the appropriate management of features of the landscape which are of major importance for wild flora and fauna and other statutory and non-statutory designated sites. The features concerned are those which, because of their linear and continuous structure or their function as 'stepping stones' or 'wildlife corridors', are essential for migration,

dispersal or genetic exchange. The protection and creation of networks of statutory and non-statutory sites and of the landscape features which provide links from one habitat to another can make an important contribution to developing resilient ecological networks and securing a net benefit for biodiversity and in doing so improve the quality of the local place and its ability to adapt to climate change.

6.2.12 A green infrastructure statement should be submitted with all planning applications. This will be proportionate to the scale and nature of the development proposed and will describe how green infrastructure has been incorporated into the proposal.

6.4.3 Recognising that development needs to take place and some biodiversity may be impacted, the planning system should ensure that overall there is a net benefit for biodiversity and ecosystem resilience, resulting in enhanced well-being. Addressing the consequences of climate change should be a central part of any measures to protect, maintain and enhance biodiversity and the resilience of ecosystems. secure the maintenance and enhancement of ecosystem resilience and resilient ecological networks by improving diversity, extent, condition, and connectivity.

6.4.4 It is important that biodiversity and ecosystem resilience considerations are taken into account at an early stage in both development plan preparation and when proposing or considering development proposals. Where adverse effects on biodiversity and ecosystem resilience cannot be avoided, minimised or mitigated/restored, and as a last resort compensated for, it will be necessary to refuse planning permission.

6.4.5 Planning authorities must seek to maintain and enhance biodiversity in the exercise of their functions. This means development should not cause any significant loss of habitats or populations of species (not including non native invasive species), locally or nationally and must work alongside nature and it must provide a net benefit for biodiversity and improve, or enable the improvement, of the resilience of ecosystems.....

6.4.11 Planning authorities must follow a step- wise approach to maintain and enhance biodiversity, build resilient ecological networks and deliver net benefits for biodiversity by ensuring that any adverse environmental effects are firstly avoided, then minimized, mitigated, and as a last resort compensated for.....

6.4.12 Having worked iteratively, in line with Figure 12, through the stages of the step-wise approach below, and providing evidence in the Green Infrastructure Statement that the step-wise approach has been followed, a scheme of enhancements must be provided to ensure a net benefit for biodiversity. Where biodiversity enhancement proportionate to the scale and nature of the development is not proposed as part of an application, significant weight will be given to its absence, and unless other significant material considerations indicate otherwise, it will be necessary to refuse permission.....

6.4.15 (2). When all locational, siting and design options for avoiding damage to biodiversity have been exhausted, applicants, in discussion with planning authorities, must seek to minimise the initial impact on biodiversity and ecosystems.....

6.4.15 (5). Each stage of the step-wise approach must be accompanied by a long term management plan of agreed and appropriate avoidance, minimisation, mitigation/restoration and compensation measures alongside the agreed enhancement measures. The management plan should set out the immediate and on-going management of the site, future monitoring arrangements for all secured measures and it should clearly identify the funding mechanisms in place to meet the management plan objectives. The management plan must set out how a net benefit for biodiversity will be achieved within as short a time as possible and be locally responsive and relevant to local circumstances.

6.4.15 (6) Finally, where the adverse effect on biodiversity and ecosystem resilience clearly outweighs other material considerations, the development should be refused.

6.4.16 Potential applicants should not conduct any pre-emptive site clearance works before submitting a planning application as this can make it more difficult for a development proposal to secure a net

benefit for biodiversity. Where a site has been cleared prior to development its biodiversity value should be deemed to have been as it was before any site investigations or clearance took place. A net benefit for biodiversity must be achieved from that point.

6.4.31 Although non-statutory designations do not have a statutory process for their protection, Sites of Importance for Nature Conservation, Local Wildlife Sites, Local Nature Reserves, and Regionally Importance Geodiversity Sites make a vital contribution to delivering an ecological network for biodiversity and resilient ecosystems, and they should be given protection in development plans and the development management process. Non-statutory sites can form the core of a vital network of threatened habitats, play an essential role in protecting, maintaining, connecting and restoring biodiversity and contribute to nature recovery and a net benefit for biodiversity. Before authorising development likely to damage a local wildlife designation, planning authorities should give notice of the proposed operation to the local authority Ecologist and third sector environmental organisations. In all cases a written opinion must be secured from the local authority Ecologist.....

6.4.35 The presence of a species protected under European or UK legislation, or under Section 7 of the Environment (Wales) Act 2016 is a material consideration when a planning authority is considering a development proposal which, if carried out, would be likely to result in disturbance or harm to the species or its habitat and to ensure that the range and population of the species is sustained.

6.4.42 Permanent removal of trees, woodland and hedgerows will only be permitted where it would achieve significant and clearly defined public benefits. Where individual or groups of trees and hedgerows are removed as part of a proposed scheme, planning authorities must first follow the step-wise approach as set out in paragraph 6.4.15. Where loss is unavoidable developers will be required to provide compensatory planting (which is proportionate to the proposed loss as identified through an assessment of green infrastructure value including biodiversity, landscape value and carbon capture). Replacement planting shall be at a ratio equivalent to the quality, environmental and ecological importance of the tree(s) lost and this must be preferably onsite, or immediately adjacent to the site, and at a minimum ratio of at least 3 trees of a similar type and compensatory size planted for every 1 lost.....

6.4.43 Ancient woodland, semi-natural woodlands, individual ancient, veteran and heritage trees and ancient hedgerows are irreplaceable natural resources, and have significant landscape, biodiversity and cultural value. Such trees, woodlands and hedgerows are to be afforded protection from development which would result in their loss or deterioration unless very exceptionally there are significant and clearly defined public benefits; this protection must prevent potentially damaging operations and their unnecessary loss.....

6.8.1 There is a need to balance the provision of lighting to enhance safety and security to help in the prevention of crime and to allow activities like sport and recreation to take place with the need to:

- protect the natural and historic environment including wildlife and features of the natural environment such as tranquillity;

BUILDING WITH NATURE

Applicants should consider standards for development design “Building with Nature” which can be found at www.Buildingwithnature.org.uk

PLANNING POLICY WALES SEPTEMBER 2009 (TECHNICAL ADVICE NOTE 5: NATURE CONSERVATION AND PLANNING)

Section 6.2.1 – the presence of a protected species is a material consideration when a local planning authority is considering a development proposal, that, if carried out, would be likely to result in disturbance or harm to the species or its habitat.

Section 6.2.2 – It is essential that the presence or otherwise of protected species, and the extent that they may be affected by the proposed development, is established before the planning permission is granted.

ENVIRONMENT (WALES) ACT 2016 - THE BIODIVERSITY AND RESILIENCE OF ECOSYSTEMS DUTY

The Environment (Wales) Act became law on 21st March 2016 and replaces the Natural Environment and Rural Communities Act 2006. It puts in place legislation to enable Wales' resources to be managed in a more proactive, sustainable and joined up manner and to form part of the legislative framework necessary to tackle climate change. The Act supports the Welsh Governments wider remit under the Well-Being of Future Generations (Wales) Act 2015 so that Wales may benefit from a prosperous economy, a healthy and resilient environment and vibrant, cohesive communities. Caerphilly County Borough Council as a public body has obligations under section 6 of the Environment (Wales) Act 2016 to demonstrate how the Local Authority will ***“seek to maintain and enhance biodiversity in the proper exercise of their functions and in doing so promote the resilience of ecosystems”***.

The intention is to ensure that in carrying out their functions, public authorities will:

- *Place biodiversity as a natural and integral part of policy and decision making within public bodies, embedding it in its plans, policies and projects and day-to-day activities*
- *Address biodiversity decline through positive actions that will result in maintenance or enhancement of our biodiversity*
- *Develop ecosystem resilience through maintaining and enhancing biodiversity*

The reporting associated with the Section 6 duty will report against the 6 NRAP objectives (see section on Nature Recovery Plan, below)

A resilient ecosystem is one that is healthy and functions in a way that is able to address the pressures and demands that are placed on it, and is able to meet current social, economic and environmental needs whilst being able to also provide the same benefits for future generation. A resilient ecosystem is the cornerstone of the “Resilient Wales” goal in the Well-Being of Future Generations Act.

STATE OF NATURAL RESOURCES REPORT (SONARR)

The Environment (Wales) Act 2016 [EWA] requires Natural Resources Wales (NRW) to publish a State of Natural Resources Report¹ (SoNaRR); to provide information on the current state of our natural resources to enable Welsh Ministers to set priorities for action at the national level. The Authority is required to have regard to the findings of this report in exercising its functions.

The SoNaRR report, finalised in September 2016 recommends a proactive approach to building resilience and for the first time links the resilience of Welsh natural resources to the well-being of the people of Wales. This Report will underpin Natural Resources Policy.

The economic and social benefits that a fully functioning environment can provide to human society include agricultural production, forestry, building materials, tourism and leisure, energy generation, flood prevention, pollination services for crops, clean water, clean air and healthy soils. The SoNaRR report spells out the major threats to the proper functioning of ecosystems in Wales, which include:

- *Climate change*
- *Land use change*
- *Over exploitation of natural resources; and*

¹ <https://naturalresources.wales/evidence-and-data/research-and-reports/the-state-of-natural-resources-report-assessment-of-the-sustainable-management-of-natural-resources/?lang=en>

- *Nutrient enrichment and pollution*

NATURE RECOVERY PLAN

The Welsh Government launched the Nature Recovery Plan² (NRP) which sets out its commitment to biodiversity in Wales and how Wales will address the Convention on Biological Diversity's [Strategic Plan for Biodiversity](#) and the associated [Aichi biodiversity targets](#) in Wales. The Nature Recovery Action Plan links to and complements The Well-being of Future Generations (Wales) Act 2015 and the Environment Act (Wales) 2016.

The NRP highlights the issues that we need to address and the objectives for action to show how, in Wales we can address the underlying causes of biodiversity loss. Specifically through:

- *Putting nature at the heart of decision making*
- *Increasing the resilience of our natural environment*
- *Taking specific action for habitats and species*

The Nature Recovery Plan consists of three parts:

Part 1: Sets out the position with regard to biodiversity in Wales

Part 2: actions identified to support biodiversity, (**The Nature Recovery Action Plan (NRAP)**)

Part 3: Under development: The Nature Recovery Framework

2.4 PREVIOUS SURVEYS

There are no known previous surveys of this site.

2.5 CONSTRAINTS

N/A

² <https://www.biodiversitywales.org.uk/Nature-Recovery-Action-Plan>

3 DESK STUDY

A desk study was not undertaken in this instance. A full suite of surveys have been undertaken at the site. All of the work will be within the confines of the site and the development is a small development on an existing house and garden.

3.1 RESULTS

3.1.1 Statutorily protected sites

3.1.1.1 European designated sites

It is extremely unlikely that any European designated site will be affected by any development on the site. All of the works will be undertaken within the confines of the site.

3.1.1.2 United Kingdom designated sites

It is extremely unlikely that any UK designated site will be affected by any development on the site. All of the works will be undertaken within the confines of the site

3.1.2 Non-statutory designations

It is extremely unlikely that any SINC will be affected by any development on the site. All of the works will be undertaken within the confines of the site.

3.2 PREVIOUS SURVEYS

None known.

4 PHASE 1 HABITAT SURVEY

4.1 SUMMARY

A number of habitats were recorded across and adjacent to the survey area. These included:

- cleared site with early successional vegetation

The potential for a number of protected species was recorded, including habitats suitable for:

- Bats;
- Great crested newt;
- Badgers;
- Otter;
- Breeding birds;
- Reptiles;
- Invertebrates;

The habitats are shown on **the phase 1 map below**

4.2 BACKGROUND

The Phase 1 habitat survey was carried out to assess the existing habitats, identify any protected habitats or species that may be present, determine the impact of the proposed works on them, and identify any mitigation measures that may be necessary. This was done by undertaking both a desk study and field survey.

The survey was undertaken on 15th July 2025.

Phase 1 habitat survey is a way of recording the basic habitat data to form a baseline level of knowledge of the ecology of a site and provide recommendations for future surveys if considered necessary.

4.3 METHODOLOGY

4.3.1 Field survey:

Experienced surveyors from BE Ecological Ltd carried out a habitat assessment and mapping exercise in July 2025 using the Phase 1 habitat survey technique. Nomenclature follows Stace (1997)³. The survey was carried out by Beth Evans and Stephen Shutt.

³ Stace, C (1997). *New Flora of the British Isles* (2nd Ed.). Cambridge University Press

Features of note are assigned Target Notes (TN) and referenced accordingly and described at the **Appendix**

4.4 CONSTRAINTS

N/A

4.5 RESULTS

4.5.1 Habitats

The following habitats were found on and adjacent to the site and are mapped below

- Semi-improved grassland/scrub
- Scattered trees
- Building
- Hedgerow
- Invasive species

Photos are located at **Appendix A**

4.5.1.1 Semi-improved grassland/scrub

This habitat was found across the main body of the site. Both habitats are intertwined due to a lack of management. The habitat is general species poor.

4.5.1.2 Scattered trees

There is a small number of scattered trees that will need to be removed to facilitate the development. The trees appear to have grown as a result of self-seeding from the southern hedgerow. Whilst there are some self seeded saplings throughout the site, mature trees are few and far between. At the time of writing it is unclear how many trees will need to be removed for the development, however, from the outline plans, it appears that two ash trees and two sycamore trees will need to be removed to facilitate the development.

4.5.1.3 Hedgerow

There is a native species mature hedgerow to the southern boundary. This will be retained within its entirety. The hedgerow is outgrown due to a lack of management.

4.5.1.4 Japanese knotweed

There is Japanese knotweed present throughout the site.

Phase 1 habitat survey map

4.5.2 Protected species assessment

4.5.2.1 Bats

Habitat suitability

It is possible that bats will use the site for foraging and commuting. There are no structures or trees on the site suitable for roosting bats.

of low potential for roosting bats and as such a single survey was undertaken.

Surveyor information

The survey was run by Beth Evans. Beth is the owner of BE ECOLOGICAL LTD and has a postgraduate degree in Environmental Biology: Conservation & Resource Management, specialising in British bats. Beth has 11 years' experience of ecological surveys, both in a small scale and large multi-disciplinary context. Beth also holds Natural Resources Wales and Natural England bat licences to disturb and handle bats.

Beth Evans was assisted during the activity surveys by Gavin Vella, Michael Rodgers and Stephen Shutt.

Internal and external inspection

An initial inspection survey was carried out in May 2025 to search all buildings, both externally to identify potential bat roosting areas and signs of bat use including; live bats, dead bats, droppings, urine staining, grease marks and discarded prey items. The buildings and all areas/items of interest were recorded and photographed. Extension ladders/steps were used to safely access roof areas and fascia boards etc; where no safe access was available the survey was conducted using, close focus binoculars and/or a high powered lamp.

External survey results

The survey undertaken by BE Ecological Ltd revealed a number of potential access points for bats, namely:

- Small gaps via missing slates
- Small gaps beneath barge boards

The presence of gaps coupled with the location of the building resulted in the building being classified as moderate potential for roosting bats. As such further surveys were undertaken of the building.

Internal survey results

An internal survey of the building was not possible. The building is extremely dangerous and entry is prohibited.

Activity surveys

Building 'emergence' and 're-entry' surveys were carried out on the following dates, times and weather conditions. Climatic conditions including rain, wind, temperature and cloud cover were recorded for each survey using a hand held Kestrel 4500 weather station.

Survey 1- 23rd June 2025

A dusk survey was carried out on 23rd June 2025 using surveyors, positioned in such a way that as much of the building was visible to surveyors as possible. Surveyors were equipped with Batlogger M detectors. IR cameras and thermal imaging devices. Placement of cameras are difficult on the north western gable due to the proximity of houses, narrow field of view and front doors. A camera was not used in this location as a result of this.

Surveyor/camera locations

Survey 2- 14th July 2025

A dusk survey was carried out on 14th July 2025 using surveyors, positioned in such a way that as much of the building was visible to surveyors as possible. Surveyors were equipped with Batlogger M detectors. IR cameras and thermal imaging devices. Different cameras were used on this occasion with a wider field of view.

Thermal imaging field of views

Survey limitations

Any survey for bat species can only be a series of snapshots in time. Bats are highly mobile, long lived creatures (capable of living up to 30 years, sometimes longer) with complex social structures and utilising multiple roost sites within a year. The implications of this are that surveys and surveyors have to make informed assumptions based on observations, recorded data, local information and a detailed knowledge of the species.

Activity surveys

The surveys were undertaken as per the table below:

Table 1: Schedule and weather conditions

Visit	Date (sunrise) (sunset)	Start End	Time	Tem p C	Wind	Cloud Cover	Notes
Survey 1 23/06/25	21:36	Start	21:15	14	Low	10%	Dry evening, insects flying
		End	23:10	14	Low	15%	
Survey 2 14/07/25	21:26	Start	21:10	15	Low	30%	Shower before survey. Dry evening, insects flying
		End	23:00	14	Low	80%	

Activity survey results

Survey 1- 23/06/25

The first bat heard was a common pipistrelle, the bat was seen flying high in the sky from south to north approximately 15 minutes post sunrise. Species heard and seen on site include common pipistrelle and myotis sp., . Activity was generally focussed around the boundaries of the site with the occasional common and soprano pipistrelle commuting over the buildings.

No bats emerged from nor interacted with the building under survey.

Survey 2- 14/07/25

The first bat heard was a soprano pipistrelle. The bat was seen commuting high above the site from east to west. Species heard on site include common pipistrelle,, soprano pipistrelle, noctule and myotis sp.,

Again bat activity was generally focussed around the southern hedgerow and scrub with the occasional bat commuting/foraging through the site.

No bats emerged from nor interacted with the building under survey.

Identified flight lines

Bat flight lines arrowed red

Impacts without mitigation

The property was not identified as a bat roost on this date, therefore impacts on roosting bats are unlikely.

Negative impacts may include disturbance from construction works, loss of foraging habitat and light spill onto commuting corridors and roosting features within the adjacent trees

Mitigation

- All boundary trees will remain in situ
- Any additional lighting will be bat friendly and in line with current guidance.
- All works will be undertaken in line with a method statement and ecological supervision

4.5.2.2 Amphibians & great crested newt

Habitat Assessment

There are no ponds present on the development site which could be used by this group for breeding purposes. It is unlikely that newts will use the site terrestrially.

Impacts without mitigation

There is unlikely to be an impact on great crested newt.

4.5.2.3 Dormouse

Habitat suitability

There is no suitable habitat for dormice on site. Dormice are not known in the locality and all boundary vegetation will be maintained.

Impacts without mitigation

There is unlikely to be any impacts on dormice as a result of the proposed development.

4.5.2.4 Badgers

Habitat suitability

There is suitable habitat for foraging but due to the location, openness and nature of the site, the land is unlikely to be suitable for sett excavation. It is possible that badger will use habitat further afield. There was no sign of badger throughout the survey.

Impacts without mitigation

There is unlikely to be any impacts on badger as a result of the proposed development.

4.5.2.5 Breeding birds

Habitat suitability

There is suitable habitat for nesting birds in the scrub, hedgerow and trees.

The habitats on the site are not considered to be suitable for ground nesting birds given the small overlooked nature of the site, the high levels of disturbance on the site,, the availability of avian predator perches and the presence of predators (cats from neighbouring houses).

Impacts without mitigation

There is no suitable nesting bird habitat on site therefore impacts are unlikely.

4.5.2.6 Reptiles

Habitat assessment

The site offers some habitat for this species for foraging, basking, sheltering and hibernation purposes and it is likely that slow worm (*Anguis fragilis*), common lizard (*Lacerta vivipara*) and grass snake (*Natrix natrix*) use the site. It is likely that small numbers of reptiles may be present on the interfaces between bare habitat and longer vegetation.

The habitat assessment looked for features that would be attractive to reptiles such as:

- South facing banks;
- Varied profile ground form;
- Basking areas;
- Vegetation cover;
- Structurally diverse vegetation;
- Potential brumation (hibernation) sites;
- Evidence of suitable prey sources;
- Connectivity to other potentially suitable reptile habitat; and
- Levels of disturbance/land management.

FIELD SURVEY

Target areas of potential reptile habitat were identified, and squares of approximately 0.5m² roofing felt were laid. This was carried out when the ground vegetation was dry, in order to prevent plant matter under the tins from rotting due to wet conditions, as this would deter reptiles from seeking refuge under them.

30 mats were put out in August 2025 in suitable target areas of habitat across the site and allowed to 'bed in' for at least one week. This time period generally will allow any reptiles in the area to discover and begin to use them as a regular basking site.

Experienced ecologists from BE Ecological Ltd undertook checks. All tins were checked seven times under suitable weather conditions and temperatures in order to determine the presence, or otherwise, of reptiles in the area.

Mats were checked during appropriate weather windows.

The mats were checked on the following dates:

21/08/25- mats down;
01/09/25;
08/09/25;
11/09/25;
18/09/25;
22/09/25;
30/09/25; and
03/10/25 - end of survey.

Where reptiles were found, species, number of animals and sex were noted

Visit number	Date	Temp	Weather	Species and no	Life stage
1	01/09/25	16	Sunny,cloudy spells, light wind	N/A	N/A
2	08/09/25	15	Some cloud, sunny spell	1 slow worm	Juvenile male
3	11/09/25	14	Sunny,cloudy spells, light wind	N/A	N/A
4	18/09/25	16	Overcast, sunny spells	N/A	N/A
5	22/09/25	17	Some cloud, sunny spell	2 slow worms	1 adult female, 1 juvenile
6	30/09/25	17	Sunny,cloudy spells, light wind	N/A	N/A
7	03/10/25	15	Some cloud, sunny spell	N/A	N/A

Impacts without mitigation

No reptiles were identified throughout the survey. Without mitigation the proposals are unlikely to have an impact on reptiles. An appropriate mitigation strategy will be required for reptiles.

4.5.2.7 Invertebrates

Habitat assessment

It is likely that common and widespread invertebrates will utilise the site.. It is possible that some Section 7 species will use the site. There is a varied mosaic of habitats on the site. There is abundant invertebrate habitat within the surrounding areas.

There are some food plants present on site for numerous invertebrates including section 7 species

Impacts without mitigation

It is considered that there will be a loss of breeding and foraging habitat for this group.

4.5.3 Other features

None.

5 CONCLUSION

The site has been put forth for development.. BE Ecological Ltd was commissioned to undertake a preliminary ecological appraisal of the site.

On the 11th October 2023, ahead of PPW12 being published, the new Chapter 6 came into force with immediate effect. Net benefit must be secured via planning applications using the step-wise approach, including the acknowledgement of off-site compensation measures and the need to consider enhancement and long- term management.

A Green Infrastructure Statement will be required to demonstrate the step wise approach.

Trees must be replaced on a three to one basis.

Local Authorities have a duty (known as the 'Biodiversity and resilience of ecosystems duty') under the Environment (Wales) Act 2016 to seek to maintain and enhance biodiversity in the exercise of their functions.

Any new planting should be native and of local a provenance of possible. Detailed enhancements will be required with any application should development be permitted at the site.

This report will be valid for 18 months from the date of survey.

6 RECOMMENDATIONS

New planting trees, shrub and wildflower will be required.

Bats

Due to the presence of foraging and commuting habitat mitigation will need to include minimising light spill onto the boundaries during and after the construction phase.

A sensitive lighting plan will need to be produced to ensure a dark buffer zone along all boundaries of the site. All lighting will be in line with the following guidance: <https://www.bats.org.uk/news/2023/08/bats-and-artificial-lighting-at-night-ilp-guidance-note-update-released>

Measures to benefit bats will be included within the housing development
e.g. installation of bat boxes on new buildings

All work will to the house will be carried out in accordance with a method statement and ecological supervision. A method statement will need to be provided at reserved matters stage.

Breeding birds

All vegetation and brash removal should be undertaken outwith the breeding season i.e. between mid-August / September and April inclusive

Any clearance close to the start and end of this period should only be undertaken following an assessment by a suitably experienced ecologist as the breeding season is not fixed and is subject to annual variation

Where clearance is required during the breeding season, all areas should be subject to an assessment no more than 48 hours in advance to check for the presence of breeding birds

Should evidence of breeding birds, in particularly nests, be recorded, no clearance may be undertaken within 15m of any nest site until such time as the nest is vacated naturally

Any post-development landscaping plan should include the provision of scrub &/or shrub habitats that can be utilised by breeding birds.

Measures to benefit birds within the housing development will be required e.g. installation of bird boxes on new buildings

Reptile

A reptile presence or likely absence survey has been undertaken. No reptiles were found throughout the course of the survey. An appropriate mitigation strategy will be required at reserved matters stage for reptiles.

A hibernaculum will be incorporated into the design

Invertebrates

Enhancement measures should include native species planting to support a wide range of pollinators and other invertebrates.

A Landscape Habitat Management Plan (LHMP) will be required at reserved matters stage.
